SSAB Oxelösund.

#52

Wear Technology Group™

SSAB Oxelösund has formed the Wear Technology Group™ (WTG) to bridge the gap in wear knowledge. They help you choose the best materials for your applications and get the highest wear performance possible, for example when it comes to service life and pay-load.

Solid Wear Competence

The WTG is committed to strengthening and developing technical information about wear and providing support to those with wear-critical applications. Working directly with our customers, we focus on finding optimal solutions, making cost performance assessments and developing new wear-reducing designs.

How good is your service life performance?

Our experts can help you increase the competitive strength of your business by adding a deeper understanding of wear. We will come to your facility and conduct a service life analysis on *your* applications and *your* specific abrasive material. We can present an analysis on your entire production or one particular application, you make the call. Find out how you can adapt and adjust your applications to improve your service life and reduce your cost/performance ratio.

Longer service life is a phone call away.

You can also contact us with your day-to-day wear questions by email or phone. We at the WTG are 100% dedicated to working with wear. Whether it's information on competing wear materials like rubber, castings, hardfacing and ceramics, corrosion-abrasion wear, high temperature wear or adhesion, let us help you get the best performance from your application.

Conquering wear through applied technology.

Three reasons for working with the Wear Technology Group™

1 To maximise service life and pay-load.

2 To increase performance reliability.

3 To minimise the downtime.
